AnyDesk Update 9.6.6: New Features and Bug Fixes for Enhanced Remote Access

The AnyDesk update on December 5, 2025, version 9.6.6 for Windows, brings a host of new features and significant bug fixes that enhance overall functionality.

New Features:

- The ability to remove hyperlinks has been added, offering users more control over shared content.
- Support for remotely restarting macOS devices with FileVault enabled has been incorporated, improving security management in diverse environments.

Bug Fixes:

- An issue that caused the main window search to fail has been resolved, enhancing the software's search functionality.
- A bug in the Desk Preview feature has been fixed, ensuring a seamless preview experience.
- The glitch preventing user images and names from displaying when connecting to older software versions has been addressed.
- A crash related to the activation of easter eggs has been rectified, providing a more stable experience.
- An inconvenience in the RMM process view that showed incorrect RAM and Swap units has been corrected.
- Adjustments have been made to the process view regarding startup time tracking and command line transmission.
- A bug affecting alert count information has been fixed, ensuring accurate data reporting.
- Sorting behavior in the process view has been improved for enhanced usability.
- An issue allowing the selection of multiple channels by dragging files over the chat list has been resolved.
- A problem preventing mention searches has been fixed, making communication more efficient.
- The "add people" button in the chat member popup, which was previously disabled, has been restored to functionality.
