# How to Fix Screen Lag on AnyDesk with Older Laptops: Tips for Better Performance

If you’re experiencing screen lag while using AnyDesk with older machines, such as a Lenovo Thinkpad T540p or an Acer Aspire T3 715, there are several solutions you can consider to improve performance.

First, check if your remote PC has a monitor connected. Many times, AnyDesk can operate optimally when it detects a monitor, as this helps maintain stable resolution and performance.

If your remote machine is running without a monitor, you might want to use an HDMI dummy plug. This small device connects to the HDMI port and simulates the presence of a monitor, which can help to avoid lag in the connection.

Additionally, make sure that your AnyDesk settings are optimized. Ensure that you’re using an appropriate resolution and that there is no network overload on your connection.

Finally, updating AnyDesk to the latest available version may resolve performance issues, as the software is continuously optimized by its developers.

By following these tips, you should be able to reduce or eliminate screen lag while using AnyDesk.
