AnyDesk Connection Limitations: Troubleshooting Tips for Free License Users

In recent days, several users have reported challenges when trying to establish more than one simultaneous connection using any of the free licenses from AnyDesk. According to comments gathered in official forums, it appears that the limitation on the number of active connections is a recent change that affects users across various operating systems, including both Windows and Linux.

Although most users have experimented with different versions of the software, such as 6.0.8, 7.0.14, and 7.0.15 on Windows, and 6.0.1 and 6.0.4 on Linux, all tests have resulted in the same limitation: establishing a new connection while another is active is not possible. This has created confusion, particularly among those who rely on AnyDesk for their daily work and anticipated more flexibility with their connections.

For those encountering this situation, there are several strategies and recommendations that could prove helpful. Firstly, it is advised to check your connection settings and ensure that there are no pending updates that may affect the software's behavior. Staying informed about AnyDesk's license usage policies is essential, as any changes to the terms can impact application performance.

Additionally, if you have any ideas or potential solutions, it is recommended to share them in community forums. User collaboration can lead to the discovery of alternative methods or even technical solutions to address this issue. There is also the opportunity to conduct deeper analyses of network traffic and connection management, something that some users have already begun exploring. If any valuable information becomes available, it would be beneficial to share it to support the AnyDesk community.

Finally, users are always encouraged to reach out directly to AnyDesk's technical support for reporting any anomalies or receiving personalized assistance. User feedback is crucial for the continuous development of the platform.
