Some Help With

AnyDesk February 2026 Update: Key Features, Enhancements, and Bug Fixes for Android and Windows

Summary of Updates and Bug Fixes in the AnyDesk Update of February 10, 2026

In the 8.3.0 update for Android, several new features and enhancements have been introduced, making it a significant upgrade. Some of the most notable additions include support for new plugins, management of the new AnyNet certificate, access to the Certificate Revocation List (CRL), and the ability for chat notifications to have inline responses. Additionally, chat logging functionality has been implemented, and the API has been upgraded to version 10. Users can now manage the camera through the AnyTime feature, with the frontend being informed when the backend needs to restart screen capture.

Regarding bug fixes, several issues have been addressed, such as incorrect icon sizes in notifications for Android versions 5 and 6, and various crashes that could occur, for example, when setting an unattended access password in use or inputting an incorrect password multiple times. Other improvements include making notifications expandable and enhancing the cursor behavior in restricted areas within the Android backend. Furthermore, the “Clear All Tokens” button has been optimized for TV remote control use, and better handling of audio and camera devices has been implemented. Stability enhancements and minor memory leak fixes have also been completed.

In the 9.6.10 update for Windows, new functionalities have been added, such as the ability to search for a specific address book and a new panel in the Monitoring section to view alerts. User interface improvements have also been made to enhance the overall user experience.

In summary, this update brings significant improvements for both Android and Windows platforms, focusing on new features and bug fixes designed to provide a smoother and more stable experience for AnyDesk users.
