AnyDesk Update 9.1.0 for Android: New Features and Essential Bug Fixes for Enhanced User Experience

On November 16, 2026, AnyDesk rolled out a significant update for its Android version 9.1.0. This release brings a host of new features and important bug fixes that enhance the overall functionality of the app.

New Features:

- The introduction of support for new plugins, expanding the application's capabilities and making it more versatile for users.
- Users with Android 13 and above can now change the app's language directly within the settings, providing a more tailored experience.
- Improved focus indication enhances navigation throughout the application, making it easier to access various functionalities.
- The AD-One interface has received design enhancements specifically for smaller screens, ensuring better visibility and usability.
- Interaction within AD-One has been streamlined, improving the overall handling of entries for a smoother user experience.

Bug Fixes:

- A fix was implemented for an issue where online statuses remained visible even after being disabled in the settings.
- Multiple minor user experience (UX) improvements were made to enhance overall performance.
- General stability of the application has been improved, resulting in a more reliable experience.
- A crash that occurred when setting the user image during assembly has been resolved.
- In AD-One, a fix was applied for the issue where quick dial elements shifted to the top upon closing the context menu.

This update underscores AnyDesk's commitment to providing a more efficient and satisfying user experience.
