AnyDesk Update April 2026: Enhanced Security and Improved Access Control for Raspberry Pi and Linux

Summary of AnyDesk Update as of April 1, 2026

In version 8.0.2, updates for both Raspberry Pi and Linux platforms addressed two significant issues.

First, a bug that prevented the remote device from being blocked at the end of a session has been resolved. This enhancement significantly improves security and access control, ensuring that users can manage their remote connections more securely.

Second, a problem related to the access control list in the settings has been corrected. This adjustment optimizes permission management and access, allowing for a more streamlined and efficient experience.

These updates are vital for ensuring a more secure and effective use of the application overall.
