AnyDesk Update: Key Bug Fixes and Enhancements for Linux, Windows, and Raspberry Pi

TABLE OF CONTENT

- Linux and Raspberry Pi (version 7.0.2)
- Windows (version 9.5.8)

In the update of AnyDesk released on July 10, 2025, a range of bug fixes and enhancements were implemented across various platforms:

Linux and Raspberry Pi (version 7.0.2)

- A major issue preventing the AnyDesk One client from connecting to chat servers has been resolved.

Windows (version 9.5.8)

- Fixes were applied to address crashes that occurred when fonts could not load without displaying the user interface.
- An issue where the correct license information did not appear has been corrected.
- The “Report Problem” option in the app now opens the default email client with logs attached for easier reporting.
- User interface animations have been improved, enhancing text readability.
- Numerous minor interface-related issues have been addressed.
- New indicators have been added to the session information window for ‘system information permissions’, ‘show pointer’, and ‘interact with restricted windows’.
- Enhancements have been made to translations for better understanding across different languages.
- Support for TLS 1.3 has been integrated, significantly boosting the security of connections.
