AnyDesk Version 7.1.2 Update: Key Enhancements and Bug Fixes for Raspberry Pi and Linux

The AnyDesk update on December 22, 2025, version 7.1.2, introduces significant enhancements and bug fixes for Raspberry Pi and Linux platforms.

Bug Fixes:

- Security vulnerabilities have been addressed, enhancing user protection.
- A missing QR code in the two-factor authentication setup dialog has been corrected.
- An issue that caused a crash when an incorrect unattended access password was entered multiple times has been resolved.
- An inconvenience where DPMS (Display Power Management Signaling) activated conditions during incoming sessions has been fixed.
- Improved detection of system proxy settings has been implemented.
- The visibility of the free license banner has been corrected.

New Features:

- A remote restart dialog has been added, which requires user credentials for outbound connections to macOS devices.
- A bug report dialog has also been implemented to assist in identifying and resolving issues.

These enhancements aim to optimize the overall user experience and bolster security in the realm of remote connections.
