Using Chat

TABLE OF CONTENT

Sending messages

Session chat history

AnyDesk lets you send messages to another user during a connection request and an active session.

Sending messages

When a user receives a connection request, an **Accept Window** appears, including a chat box. Regardless of whether the session has been accepted, both users can exchange messages.

During an active session, the initiating user can open the chat window by clicking

chat

from the toolbar.

Session chat history

AnyDesk stores chat history locally for both standard and custom clients.

By default, the chat logs can be found in the following locations:

Standard clients

Custom clients

- **Windows**: `%appdata%\AnyDesk\chat`

 © 2026 www.somehelpwith.com

- **macOS/Linux**: `~/.AnyDesk/chat`
- **Windows**: `%appdata%\AnyDesk\ad_<prefix>\chat`
- **macOS/Linux**: `~/.AnyDesk-ad_<prefix>/chat`

Chat logs are organized by the AnyDesk ID of the remote device. All messages exchanged between the same IDs, even across multiple sessions, are merged into a single log file.
