Some Help With

Manage permission sets

TABLE OF CONTENT

- Create a permission set
- Assign permission set to a new role

> **License:** Ultimate-Cloud

Permission Sets define what users can view and manage within the my.anydesk II management console. You can use permission sets to control access to specific features and pages based on user roles.

> 🦉 For instructions on assigning permission sets to role, see **this article**.

Create a permission set

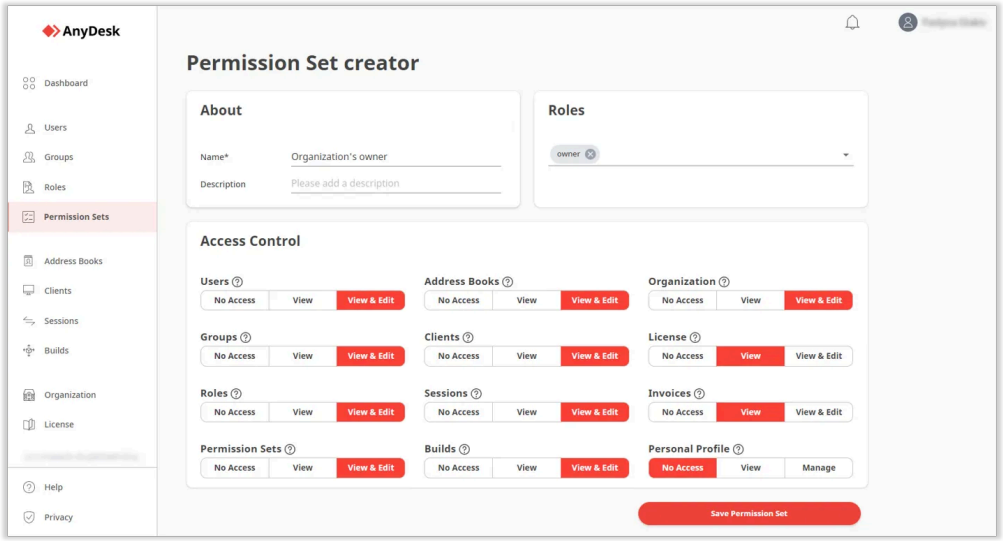

Once you create a permission set, it cannot be edited. After you create a permission set, you must assign it to a role or group.

To create a permission set:

1. In my.anydesk II, go to **User Management** > **Permission Sets** and click **Create Permission Set**.
2. On the opened page, provide the following details:
    - **About** - general information about the permission set.
        - **Name** - enter the name for the permission set.
        - **Description** - provide a short discription of the permission set.
    - **Roles** - from the drop-down list, select the roles to which you want to assign this permission set.

💡 *You can also assign the permission set to roles later in the **User Management** > **Roles** section.*

- **Access Control** - for each section of the management console, select the level of access - *No Access, View, View & Edit*.

create a permission set

3. Click **Save Permission Set**.

Assign permission set to a new role

To assign a permission set to a role:

1. In my.anydesk II account, go to **User Management** > **Roles**.
2. Open the role, find the **Permission Sets** section, and click **Edit**.
3. Click **Assign Permission Set**, and then select one or more permission sets from the list.
4. Click **Submit**.

Users with that role now have access levels as defined by the assigned permission sets.
