Enhance Cursor Visibility in AnyDesk: Tips for MacBook Users Controlling Windows PCs

If you are using AnyDesk to control your Windows PC from a MacBook, you may have noticed that the text cursor, which appears as a thin black line, can be difficult to see, especially in text editors with dark themes like VSCode. This is a common concern among users, as cursor visibility is crucial for a smooth user experience.

One potential solution to this issue is to adjust the settings in AnyDesk and your operating system. First, check if you have enabled the cursor visibility option in AnyDesk's settings. Ensure it's configured to display the active Windows cursor, which has a white outline and is more visible against dark backgrounds.

Additionally, consider modifying the editor's theme or using extensions that offer more visible cursors. Some users opt for theme customization that includes more prominent cursor styles, which can be an effective solution.

If the issue persists, it would be beneficial to reach out to AnyDesk's technical support or consult the AnyDesk forum where other users share their experiences and solutions. You can also provide detailed information about the problem you're facing to receive specific assistance.

We hope these suggestions help improve cursor visibility in AnyDesk and make your experience much more enjoyable. Feel free to share your experience or any additional solutions you find helpful.
