3. Compliance with Security Policies

4. Improved Resource Management

How to Configure AnyDesk for Incoming Connections

AnyDesk, one of the most popular remote access solutions, offers a feature that allows configuring the software exclusively for incoming connections, limiting users' ability to initiate outgoing connections. This feature is available starting from the Standard licenses and above, providing an additional level of security and management.

Security and Control Benefits

1. Protection Against Unauthorized Access

By limiting AnyDesk to only accept incoming connections, the risk of employees using the software to connect to external devices is minimized. This reduces the possibility of sensitive company data being transferred outside the secure corporate environment.

2. Reduction of External Vulnerabilities

Outgoing connections can be an open door to various vulnerabilities. By disabling them, a potential attack vector that cybercriminals could exploit to access the company's internal network is closed.

3. Compliance with Security Policies

Many organizations have strict policies regarding remote access and data exchange. Configuring AnyDesk for incoming connections helps comply with these policies, ensuring that all remote accesses are duly authorized and monitored.

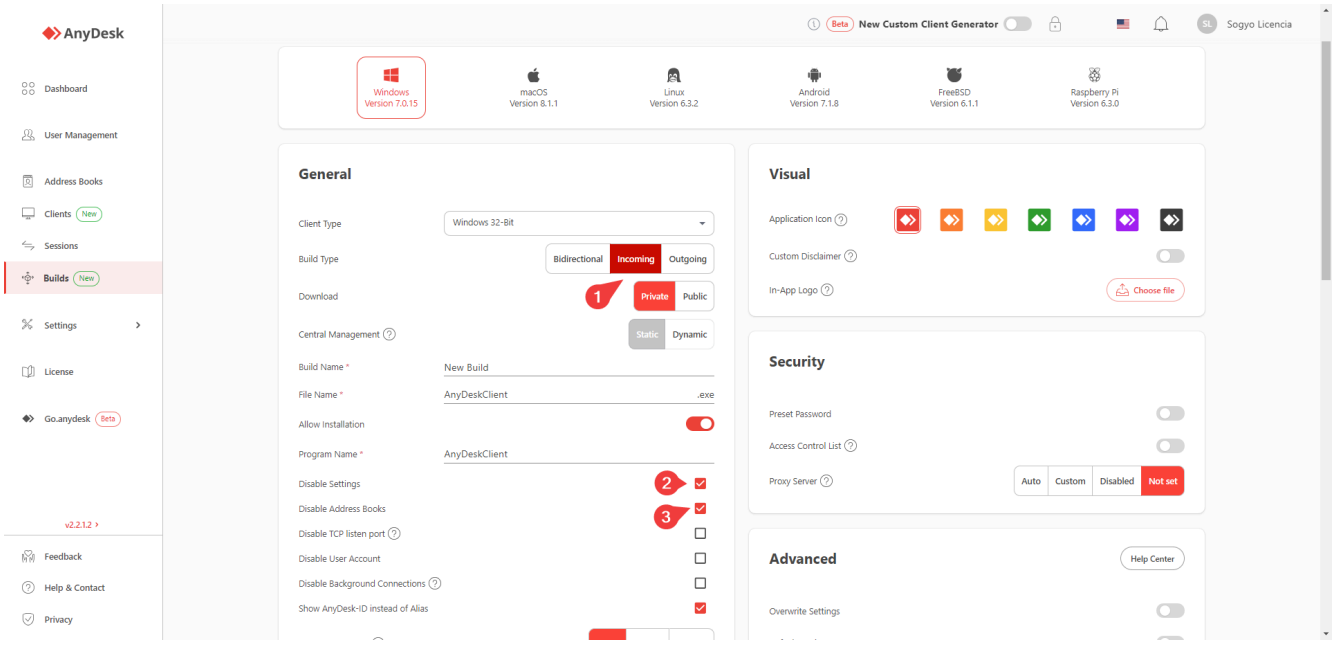

4. Improved Resource Management

Control over remote connections allows IT administrators to better manage resources and monitor the use of AnyDesk, ensuring it is used only for purposes approved by the company.

How to Configure AnyDesk for Incoming Connections

Configuring AnyDesk to only accept incoming connections can be done by creating a custom package. Here's how to do it:

1. **Access Your AnyDesk Account**: Log in to your AnyDesk account and go to the device management section.
2. **Create a Custom Package**: Use the AnyDesk package creation tool to customize the application's settings. Select the option to allow (1) only incoming connections. You can also (2) disable the options menu and (3) the address book.

3. **Distribute the Package**: Once the package is created, distribute it to your employees' devices. Ensure it is installed correctly and that security settings are enabled.

4. **Monitor and Manage**: Use AnyDesk's administration tools to monitor incoming connections and ensure the software is being used in accordance with company policies.
