Some Help With

Fix Anydesk Mouse Lag: Tips to Improve Responsiveness and Performance

If you have noticed that using Anydesk is causing sluggishness or delays in the mouse movement on your main computer, you are not alone. Many users have reported that simply having Anydesk running in the system tray can significantly impact mouse responsiveness.

A common cause of this issue may be the hardware acceleration settings within Anydesk. Often, disabling hardware acceleration in the Anydesk settings can enhance mouse fluidity. To do this, navigate to **Settings > Display** and turn off the **Hardware Acceleration** option.

Additionally, in some cases, it has been suggested to disable the FPS limit for Anydesk.exe, as this can help alleviate mouse latency caused by redraw issues. For those with specific monitor setups, such as monitors running at 60Hz, lowering the refresh rate to 30Hz has improved the user experience, though this can vary depending on each user's system configuration.

If the issue persists, try closing and reopening your Anydesk session; this can help reset the connection and apply any new changes you've made to the settings.

We hope these suggestions assist you in enhancing your experience with Anydesk. If you continue to encounter issues, feel free to visit our support forums where other users and experts can offer you additional tips and solutions.
