How to Easily Transfer Screenshots Between Local and Remote PCs in AnyDesk

Have you ever faced the issue of not being able to paste screenshots from your local PC to your remote PC in AnyDesk? Don’t worry; this is a common inconvenience that many users encounter.

Copying and pasting text between devices is seamless, but screenshots can prove to be trickier. Currently, AnyDesk does not natively support pasting images directly into the remote desktop session. This means that even if you can copy a screenshot, you won’t be able to paste it directly into your AnyDesk session.

Fortunately, there’s a simple workaround: the file transfer feature. This allows you to send your screenshot as a file from your local PC to your remote PC. Be sure to save your screenshot as an image file (such as PNG or JPG), and utilize the file transfer option in AnyDesk to send it to your remote device. Once transferred, you’ll be able to open the image on your remote PC without any hassle.

If you’re using unattended access mode, you may encounter additional challenges with the paste functionality. Make sure you are using the latest version of AnyDesk, and consider restarting the session or even the application if the issue persists.

We hope these suggestions help you resolve any inconveniences and enhance your experience with AnyDesk. If you have any further questions or require additional assistance, don’t hesitate to reach out to our technical support team.
