Some Help With

How to Enable the Keyboard on Your iPad While Using AnyDesk: A Simple Guide

If you're looking to enable the keyboard on your iPad while using AnyDesk, you're in the right place. Many users have encountered this challenge, and here we provide a straightforward solution to it.

First, ensure that your iPad is properly connected to the Internet and that you have the latest version of AnyDesk installed. When you're in a remote session, you can interact with your local keyboard, which will automatically appear whenever you tap on any text field in your remote device. If the virtual keyboard doesn't show up, you can enable it by following these steps:

1. **Access the Action Menu**: During the remote session, tap on the screen to display the action menu.
2. **Enable the Virtual Keyboard**: Look for the option that says 'Show Virtual Keyboard'. By activating this option, the keyboard should appear on your screen.
3. **Toggle Input Modes**: If you need additional functionalities, such as function keys or CTRL, you can switch between standard and special modes from the mentioned menu.

At times, if the keyboard settings of your local and remote devices differ, AnyDesk may automatically switch to local mode, which can impact your typing experience.

If you're still experiencing issues, it's advisable to check your keyboard settings on the iPad and make adjustments as necessary. For additional technical support, consider visiting the AnyDesk support page or exploring community help forums.

Keep in mind that your experience may vary depending on the version of the operating system you're using and the specific settings of your device. Good luck!
