Some Help With

How to Fix AnyDesk Connection Issues with Multiple PCs: Troubleshooting Tips

If you're a user of AnyDesk and are encountering issues while trying to connect to multiple PCs on your network, it could be due to certain configurations related to the free version of the application. While the free version of AnyDesk allows up to three simultaneous connections, seeing an error message on each PC in your network may indicate multiple underlying issues.

First, confirm that you have only one active connection at that moment. If you have had previous sessions open that were not closed properly, AnyDesk may still consider them active. Close all AnyDesk sessions that you are not currently using and try again.

Additionally, ensure that all network settings on your PCs are correct. Sometimes, connection problems can occur if devices are set up as Public networks instead of Private. Review the network settings on each PC and adjust them as needed.

If you continue to experience issues, try connecting using the local IP address of the other PC instead of global identifiers to ensure a more stable connection.

Remember that for further assistance, you can access the AnyDesk support documentation, where you'll find guides that can help you troubleshoot common connection problems. Thank you for using AnyDesk, and we hope these suggestions help you reconnect seamlessly.
