# How to Fix AnyDesk Screen Flickering and Glitches: Troubleshooting Tips

If you've ever wondered why the remote screen of AnyDesk shakes or experiences glitches, you're not alone. Such issues can be quite frustrating; however, effective solutions are available to alleviate them.

One of the most common causes of screen flickering is an unstable Internet connection. When the connection is interrupted or experiences fluctuations, the data from the remote session may not transmit properly, leading to erratic screen behavior.

To address this issue, it's advisable to restart the AnyDesk service. This can help reset the connection and enhance the stability of the display. Simply closing the application and reopening it or even restarting the device you are using can make a significant difference.

Additionally, ensure that both the local and remote devices are updated to the latest version of AnyDesk software. Updates typically include improvements and bug fixes that can resolve technical issues like this one.

If you continue to experience screen glitches after following these steps, consider checking your network. Limited bandwidth or interference in the Wi-Fi connection can negatively impact the quality of the remote session.

Remember that maintaining a strong connection and ensuring both devices are up to date are key factors in enjoying a smooth remote experience with AnyDesk.
