How to Fix Central Management Disabled Issue in AnyDesk Build Creation

Are you experiencing issues with central management being disabled while trying to create a new build in AnyDesk? This is a common problem that can be resolved by following a few simple steps.

First, ensure that you have correctly entered the private key in the designated section. Without this key, central management will not be activated, resulting in it appearing disabled on the final page of the build creation process. Additionally, make sure that you have enabled the “Dynamic Management” option in the settings section when creating your build.

It’s advisable to double-check that all configurations are accurately completed before proceeding to the final step. If you still find that central management remains disabled, try logging out and back into your AnyDesk account, or even restart the build creation process from the beginning.

Keep in mind that central management provides the advantage of making instant changes to your custom builds, making it crucial for this feature to be enabled correctly.

For more information on how to manage your account and create effective builds, visit our help section on the AnyDesk website. We are here to assist you!
