Some Help With

# How to Fix Keyboard Input Issues in AnyDesk During Sahrex Screen Recordings

If you're an AnyDesk user experiencing keyboard input issues when using Sahrex to record your screen, you're not alone. Many users have reported that after starting a screen recording, keystrokes do not register correctly on the remote computer. Here are some solutions that might help you resolve this inconvenience.

1. **Restart AnyDesk**: Sometimes, simply restarting the application can fix minor glitches. If you're having trouble with keyboard shortcuts, try closing and reopening AnyDesk.
2. **Disable the "Send shortcut keys" option**: While you mentioned that you have already disabled this setting, it's crucial to ensure that it is indeed turned off. Check the AnyDesk settings to confirm this.
3. **Check screen recording permissions**: Make sure Sahrex has the appropriate permissions on your operating system to record the screen. You can verify this by going to the Security and Privacy settings on your computer and adjusting the screen recording preferences.
4. **Minimize and restore the AnyDesk window**: Some users have found success in minimizing the AnyDesk window, typing in a different program, and then copying and pasting the text back into the AnyDesk window. While this may not be an ideal solution, it can serve as a temporary workaround while you search for a more permanent fix.
5. **Restart the remote computer**: Although you mentioned that restarting the remote computer temporarily resolves the issue, it indicates that there may be a deeper problem related to system resources or the interaction between the applications. If this is a recurring issue, consider checking resource usage and updating relevant drivers or software.

We hope these suggestions help alleviate the keyboard input problem during screen recordings with Sahrex and AnyDesk. If the issue persists, don't hesitate to reach out to AnyDesk's technical support for personalized assistance. Thank you for being part of the AnyDesk community!
