Some Help With

How to Set Up AnyDesk on Your iPad for Seamless Remote Access to Your Server

If you've purchased the SOLO subscription of AnyDesk and want to use your iPad to access your server without limits, you've come to the right place. Setting up your iPad as a client is a straightforward process that will allow you to enjoy the full remote control functionality on your iOS devices.

To get started, download the AnyDesk app from the App Store on your iPad. Simply search for "AnyDesk" and click the download button. Once the app is installed, open it, and you will see a unique AnyDesk number generated automatically. This number is essential for establishing the connection with your server.

Next, on the device you wish to access (your server), make sure that AnyDesk is also installed and running. Enter the AnyDesk number from your iPad in the corresponding field on your server and request the connection. Remember to allow access from the server, as you will need to accept the request on that device to initiate the remote control.

Once the connection is established, you will be able to control your server from your iPad efficiently and with complete functionality. If any issues arise, check that both devices are connected to the internet, and ensure that security settings are not blocking the connection.

Don't hesitate to enjoy the convenience AnyDesk offers for managing your devices from your iPad, making remote work not only possible but incredibly convenient.
