Some Help With

How to Set Up Unattended Access on Your Android Device for Remote Control

If you need to access your Android device remotely while you're at work, it's crucial to ensure that Unattended Access is set up correctly. Remember, some Android devices may require specific steps to prevent access issues. Here's a step-by-step guide to help you set this up:

1. **Open AnyDesk**: Launch the AnyDesk application on your Android device.
2. **Configure Permissions**: Navigate to *Settings* > *Permissions* > *Permission Profiles*. From the list, select *Unattended Access*. Make sure to enable this feature.
3. **Battery Settings**: Open the *Settings* app on your Android device. Go to *Apps* > *AnyDesk* > *Battery*. Set the option to *No Restrictions* to allow full background activity for the app.
4. **Remote Access**: Ensure your device is unlocked at least once before attempting to access it remotely without assistance.
5. **Test Connection**: Try connecting to your device from another device. If the configuration has been completed successfully, you should be able to access it without needing to manually click the screen share button each time.

If you encounter any issues after following these steps, check if your AnyDesk app needs an update or if any additional adjustments are needed in your device's settings. Keep in mind that there may be variations in menus and options depending on the device you are using.
