How to Transmit Audio in AnyDesk When Your Device is Muted

In the realm of remote access technology, many users find themselves wondering how to transmit audio when their current device is muted. This is a common and understandable question, especially in settings where audio plays a vital role in comprehending shared information.

The good news is that AnyDesk allows for audio transmission from the remote device to the local device, meaning you can hear the audio from the remote system even if your own device is muted.

To ensure that audio is transmitted correctly, follow these steps:

1. **Connect to the remote session**: Begin your connection through AnyDesk.
2. **Check audio settings**: Make sure to enable the audio transmission option in the AnyDesk settings. This option is typically found in the application preferences.
3. **Volume adjustments**: Even if your device is muted, you can still adjust the volume of the audio coming from the remote session within your application.

Keep in mind that audio quality may also depend on your internet connection and the performance of both devices. If you need further assistance, our technical support section is available to help you.

With these simple configurations, you can maintain effective communication and enjoy a seamless user experience with AnyDesk, even when your device does not output sound.
