Some Help With

How to Troubleshoot AnyDesk Connection Delays: Tips for Optimizing Performance

In the AnyDesk community, we've observed that some users have experienced delays in connection time of up to 90 seconds, which can be quite frustrating. Allow us to provide a kind and professional response to this situation.

The delays you mentioned can arise from several factors that can be addressed. First, it's crucial to check your internet connection. An unstable network can significantly impact your experience with AnyDesk. Additionally, ensure that there isn't any other software consuming excessive bandwidth during your remote session.

It is also advisable to review your software settings. Sometimes, configurations such as image quality protocol can influence connection speed. We recommend exploring AnyDesk's configuration options and adjusting the image quality to balance performance and quality, which may help to reduce those waiting times.

If the issue persists, we encourage you to reach out to our technical support team. We are more than happy to assist you in resolving any inconveniences you may encounter. AnyDesk aims to deliver a smooth and efficient experience, and we're here to support you every step of the way.

We appreciate your feedback and hope you continue to use AnyDesk. Your satisfaction is our priority.
