How to Use USB Devices Remotely with AnyDesk: Current Limitations and Future Enhancements

In today's work environment, the demand for tools that facilitate remote work has significantly increased, and AnyDesk stands out as an effective solution for accessing computers remotely. Recently, a user raised a question in our forum regarding the possibility of remotely using USB devices, specifically connecting a CAD mouse through AnyDesk.

At this time, AnyDesk does not support USB device forwarding for remote connections as suggested in the inquiry. However, we do offer an advanced functionality that allows efficient control of other devices via remote connection.

If you need to use USB devices such as a mouse or a joystick, we value your input as it helps us continue developing features that enhance the user experience. We encourage you to send your suggestions directly through our support channel or post them in our forum.

Thank you for your interest in improving AnyDesk's capabilities. We assure you that we are continually working on new functionalities to meet our users' needs. Be sure to follow us for updates on future additions and enhancements to our software.

We hope this information has been helpful. If you have more questions, please feel free to reach out to us.
